	User Story
1	As a player, I hope that at the start of each level, I'll first see the challenges for that level along with a brief explanation of the relevant content, so that I can follow the proper sequence of learning before attempting the challenges.
2	As a player, I hope to see feedback on my performance (a scoring system) after I complete each level's challenge. I want to know whether I did well or poorly so I can decide if I want to keep challenging myself to achieve a higher rating.
3	As a player, I want the physical interactions—such as movement and collisions—to feel smooth and natural, with responsive feedback, so that the gaming experience is comfortable and enjoyable.
4	As a player, I hope to receive accurate feedback (indicating whether I've dragged the code blocks to the correct locations) as I complete the challenges using the drag-and-drop code blocks.
5	As a player, I hope to learn basic coding fundamentals through interactive drag-and-drop code blocks and a run button to watch the execution of the blocks I chose.
6	As a player, I hope to understand how small changes in code sequence can make a big difference overall in the execution. I want to see when I click the run button, each line of code being executed and the result of that on the display screen.
7	As a player, I hope to be able to quickly fix mistakes and make changes to the code by rearranging or replacing code blocks easily.
8	As a player, I hope to see immediate visual feedback when I run my code.
9	As a player, I hope to gradually build confidence in coding through the simple challenges that build off of each other.
10	As a player, I hope to develop debugging skills by identifying errors and fixing them to create the desired results.
11	As a player, I hope to be able to replay any previous completed level at any time, so I can practice again or try to achieve a higher score.
12	As a player, I hope that when my code produces an error or an unexpected result, I receive a clear and friendly error message explaining what went wrong so that I can learn from mistakes.
13	As a player, I hope that drag and drop interface prevents me from placing code blocks in invalid positions so that I can learn logic rather than worrying about the syntax errors.
14	As a player, I hope to see a progress map or level overview showing which level I've completed and which ones are still blocked so that I can clearly track my learning progress.
15	As a player, I hope the run button is disabled or greyed out when required code block slots are still empty so that I 'm reminded to complete my solution before executing it.

16	As a player, I hope there is a hint button when I am stuck showing a single hint without showing the direct answer so I can still have a good learning experience while solving the problem myself.
17	As a player, I want to have a save/load button to store my game progress so it doesn't get lost.
18	As a player, I hope to navigate between the start page, level selection, and game page easily using back buttons, so I never feel stuck or lost in the UI.
19	As a player, I hope the block palette only shows the blocks relevant to the current level, so I'm not overwhelmed with options I haven't learned yet.
20	As a player, I hope to see a visual animation of the game character executing each code block step by step when I press Run, so I can connect my code to the result on screen.
21	As a player, I hope to be able to remove individual code blocks from my workspace by dragging them out, so I can cleanly edit my solution without resetting everything.
22	As a player, I hope the workspace clearly shows empty slots or a drop zone indicator so I always know where I can place code blocks.
